

SOLAR SHRINK[®]

Patented, High-Performance Agricultural Mulch That Shrinks in the Sun

Once applied to the bed and exposed to sunlight, Solar Shrink mulch permanently shrinks, conforming to the surface of the bed. The tight fit and tough molecular structure reduces the risk of wind damage to seedlings and plants while improving water and heat retention. Manufactured to be half as thick and 40% lighter than standard black mulch film, Solar Shrink rolls are more efficient and easier to handle when laying. The lower volume means less plastic to dispose of at the end of the season. Excellent choice for home gardeners and commercial growers. Ideal for organic growers.

THINNER & LIGHTER

Up to 50% thinner and 40% lighter than conventional film mulch.

Cutting the size and weight of each roll by as much as half reduces stress on your equipment and farm crew, making your early and late season workload lighter.

TOUGHER & TIGHTER

High tensile strength polymer film saves time laying and removing.

As the film is exposed to heat and sunlight, it shrinks tightly to the contour of each row allowing for better moisture retention and minimizing loose flaps that can lead to wind damage.

NEXT GENERATION SUSTAINABILITY

Engineered for better performance with 40% less plastic waste.

To achieve the necessary strength and durability with 40% less material, higher grade polymers are required in the manufacturing process of Solar Shrink. These materials are compatible with organic farming and can be recycled*.

4 Sizes Available by the Roll

6382 48" x 300'

6383 48" x 1,000'

6384 48" x 2,500'

6385 48" x 4,000'
